

# Service config

This section explains about the tools to prepare and execute service-based changes

---

## Custom wizards

Depending on your customer license and custom-build wizards, these tools are included in this menu. For the corresponding wiki-articles, please refer to the wiki-sidebar menu items with your customer name.

## CSV API

The CSV API is a generic tool to use the YCE API indirectly. Instead of submitting an XML formatted message using an external application (or the API Exchange test tool), CSV formatted lines can be dropped in this tool to launch service types. The tool is primarily intended for on-boarding existing networks.
